Not illustrated. 1920 Excerpt: . . . the appearance of the cultures is frequently markedly different from the more slowly growing ones at room temperatures. It seems to me that we should subject the organism used in such studies to approximately the same temperature conditions to which it is exposed in nature rather than to temperatures which are decidedly abnormal to the fungus. It seems that the growth of *Aspergillus* at 25C. may be more fittingly termed normal than the growth which the mold may make at a temperature of 34C. For this reason all of my cultures were either grown in the dark at room temperatures fluctuating between 20 and 22C. , approximately, or at a constant temperature of 25C. i Duration of the experiments. The time factor of a culture greatly influences its dry weight yield. The dry weight of a culture should, without question, be determined at the moment...
